Some early evidence of dark matter

Galaxy Clusters

- Coma Cluster
- Visible Mass
 - Galaxies $\sim 10^{13} M_{\odot}$
 - X-ray $\sim 10^{14} M_{\odot}$
- $\Delta V \sim 1000$ km/s
- $R \sim 9$ light years
- $\langle v^2 \rangle \sim \frac{GM}{R}$
- Total gravitational mass $M \sim 10^{15} M_{\odot}$

~1930 Zwicky
Coma Cluster

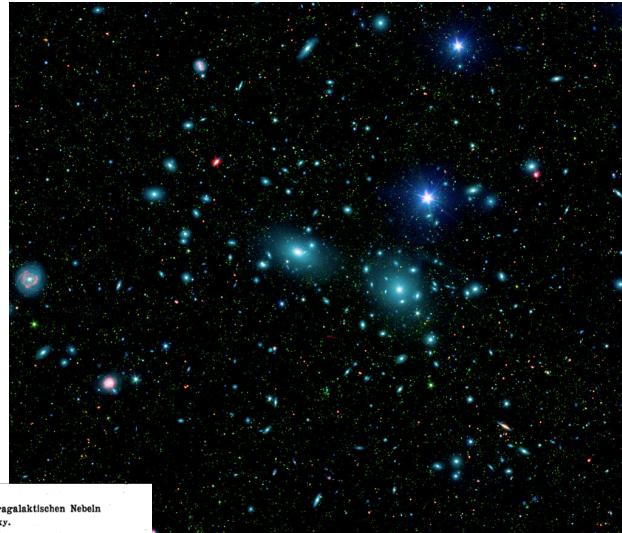

Velocity \sim Gravitational mass $>>$ Observable mass

Die Rotverschiebung von extragalaktischen Nebeln
von F. Zwicky.
(16. II. 33.)

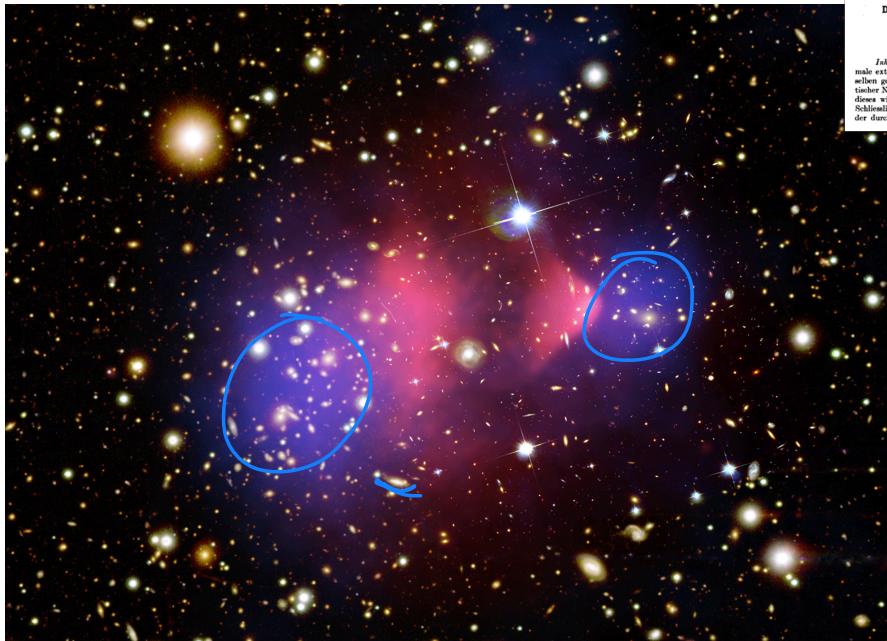

Inhaltsangabe. Diese Arbeit gibt eine Darstellung der wesentlichsten Merkmale extragalaktischer Nebel, sowie der Methoden, welche zur Erforschung derselben gedient haben. Insbesondere wird die sog. Rotverschiebung extragalaktischer Nebel eingehend diskutiert. Verschiedene Theorien, welche zur Erklärung dieses wichtigen Phänomens aufgestellt worden sind, werden kurz besprochen. Schliesslich wird angedeutet, inwiefern die Rotverschiebung für das Studium der durchdringenden Strahlung von Wichtigkeit zu werden verspricht.

Galaxy Clusters

Einleitung. Diese Arbeit gibt eine Darstellung der wesentlichsten Merkmale extragalaktischer Nebel, sowie der Methoden, welche zur Erforschung derselben gedient haben. Insbesondere wird die sog. Rotverschiebung extragalaktischer Nebel eingehend diskutiert. Verschiedene Theorien, welche zur Erklärung dieser Rotverschiebung herangezogen werden, werden verglichen. Schließlich wird angeleitet, inwieweit die Rotverschiebung für das Studium der durchdringenden Strahlung von Wichtigkeit zu werden verspricht.

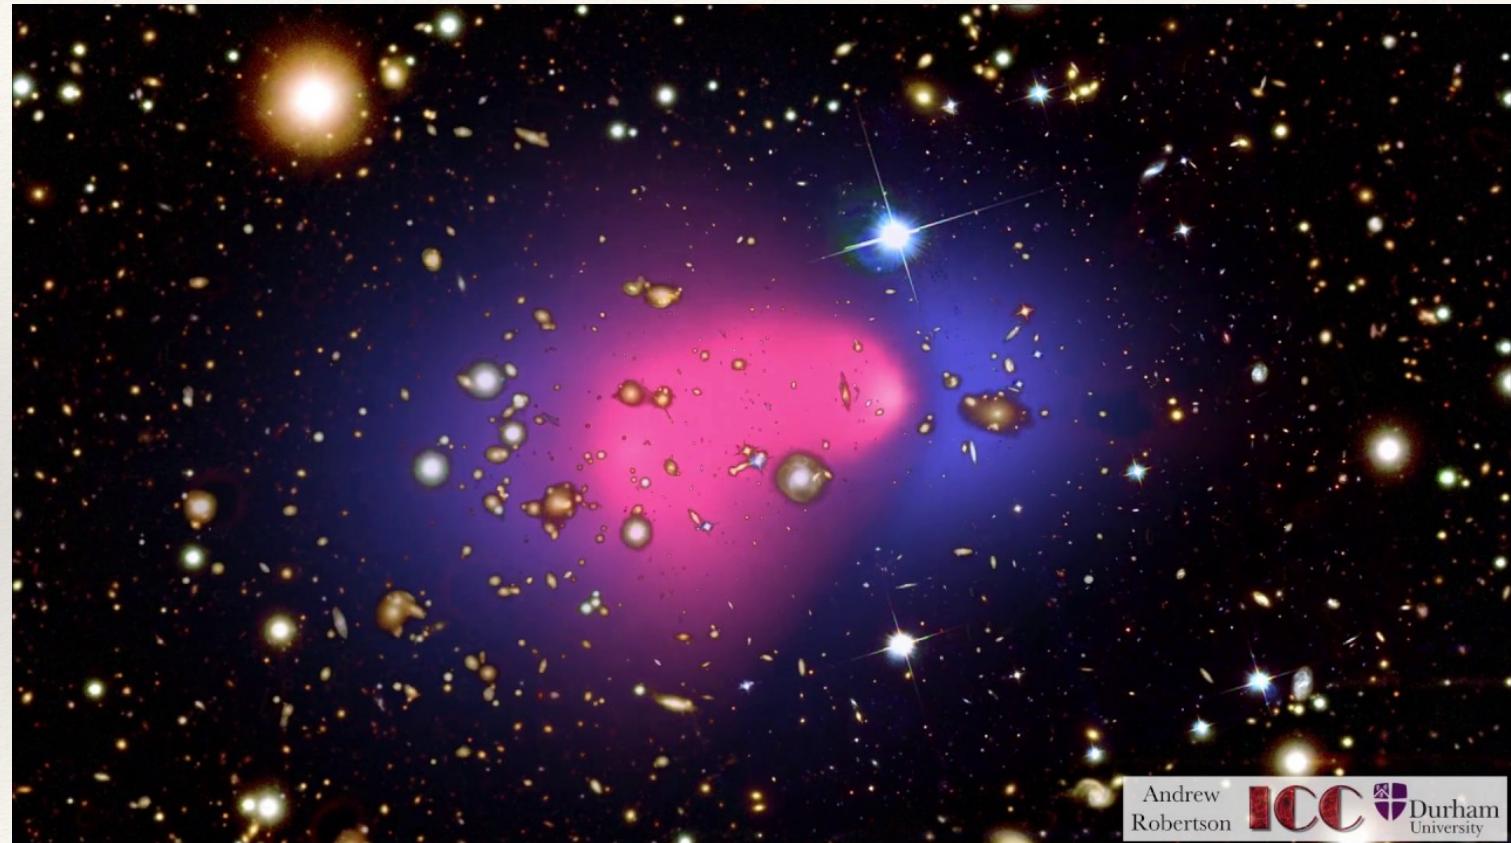

$$y \sim \text{Gravitational mass} \gg \text{Observable mass}$$

Gravitational mass from gravitational lensing(blue)
Baryonic mass form X-ray (red)

==> Missing mass -> “collisionless Dark Matter”

Bullet Cluster

- ❖ Hot gas
 - ❖ Dominant baryons
 - ❖ Traced by X-ray
- ❖ Total mass
 - ❖ Traced by gravitational lensing
- ❖ Clear separation
- ❖ If it is a gravity problem
 - ❖ Hard to explain the asymmetry

Rotation Curves

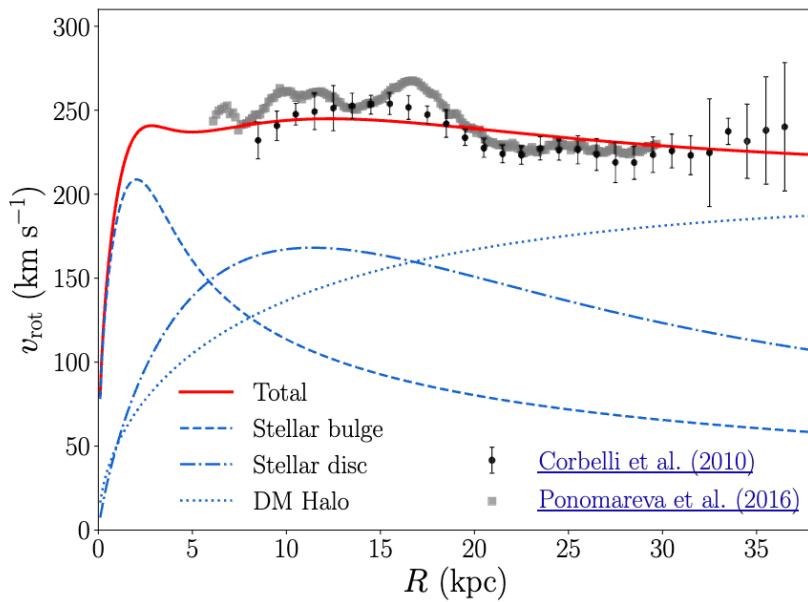

Figure 2. Rotation curve decomposition of M31 adopted in this work. The data points come from H I 21 cm emission and are taken from [Corbelli et al. \(2010\)](#) and [Ponomareva et al. \(2016\)](#). The red curve shows the total circular speed predicted by our model, fairly in agreement with the observations. The total circular speed is given by the sum of three different components: a stellar bulge (dashed curve), a stellar disc (dot-dashed curve), and an NFW DM halo (dotted curve) (see Section 3.1).

Unobserved mass contributes to gravity

The Dark Matter problem

- ❖ There seems to be a mismatch between observations of matter, versus their expected gravitational effect.
- ❖ 1. There are more matter than we can see
 - ❖ Particle dark matter solution
 - ❖ We will focus on this
 - ❖ 2. (Option 2) The theory of gravity is wrong
 - ❖ Modified gravity solution.

Modified Newtonian Dynamics (MOND):
Observational Phenomenology and Relativistic Extensions

Abstract

A wealth of astronomical data indicate the presence of mass discrepancies in the Universe. The motions observed in a variety of classes of extragalactic systems exceed what can be explained by the mass visible in stars and gas. Either (i) there is a vast amount of unseen mass in some novel form – dark matter – or (ii) the data indicate a breakdown of our understanding of dynamics on the relevant scales, or (iii) both. Here, we first review a few outstanding challenges for the dark matter interpretation of mass discrepancies in galaxies, purely based on observations and independently of any alternative theoretical framework. We then show that many of these puzzling observations are predicted by one single relation – Milgrom's law – involving an acceleration constant a_0 (or a characteristic surface density $\Sigma_\dagger = a_0/G$) on the order of the square-root of the cosmological constant in natural units. This relation can at present most easily be interpreted as the effect of a single universal force law resulting from a modification of Newtonian dynamics (MOND) on galactic scales. We exhaustively review the current observational successes and problems of this alternative paradigm at all astrophysical scales, and summarize the various theoretical attempts (TeVeS, GEA, BIMOND, and others) made to effectively embed this modification of Newtonian dynamics within a relativistic theory of gravity.

Precision data about dark matter

Big Bang Nucleosynthesis

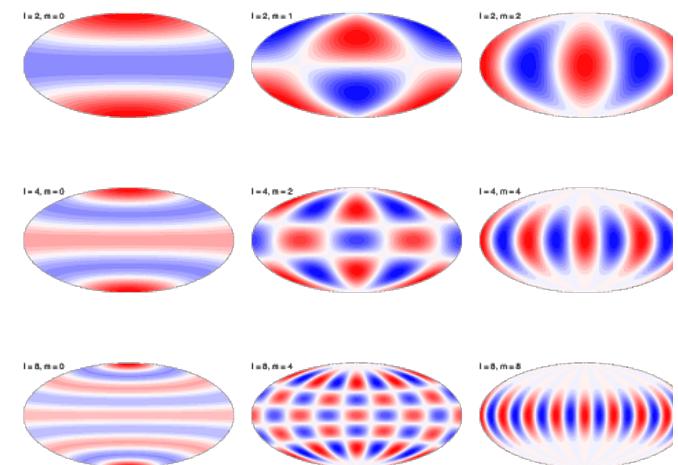

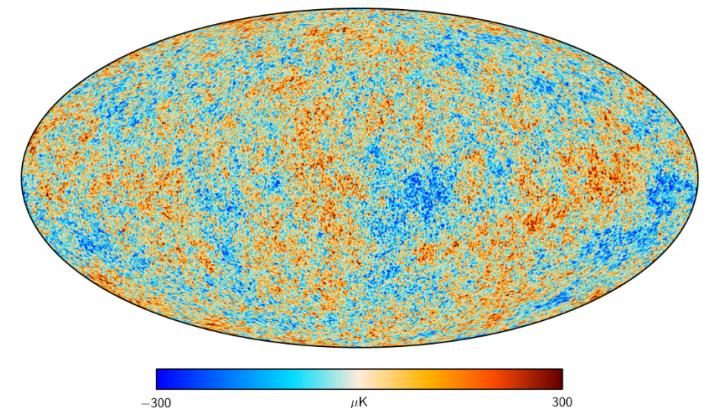

- The prediction of BBN only depends on 1 parameter.
- The Baryon to Photon ratio.
- By measuring different elements.
- $\eta \simeq 6 \times 10^{-10}$
- $n_\gamma \sim 400 / \text{cc}$
- $\rho_b \simeq m_p \times \eta \times n_\gamma = 2.4 \times 10^{-7} \text{ GeV/cc}$
- $\rho_{cr} \simeq 1.05 h^2 \times 10^{-5} \text{ GeVcm}^{-3}$
- $\Omega_b \sim 0.05$
- From Supernova cosmology, we already know that
- $\Omega_\Lambda \sim 0.7, \Omega_M \sim 0.7$
- Baryons are insufficient to explain

CMB Anisotropy

FLUCTUATIONS IN THE COSMIC MICROWAVE BACKGROUND

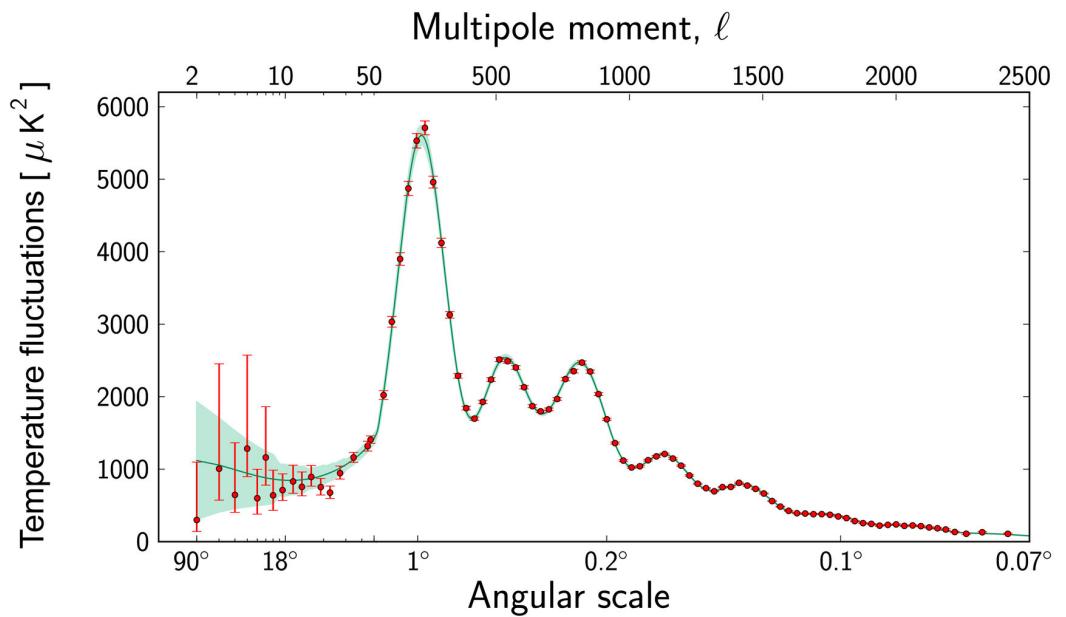

- The CMB is very smooth, but not exactly.
- There are 10^{-5} relative fluctuations
- Can do a spherical harmonic decomposition, which reveal the “power” at characteristic angular scales
 - Similar to 1-D Fourier transform

CMB Anisotropy

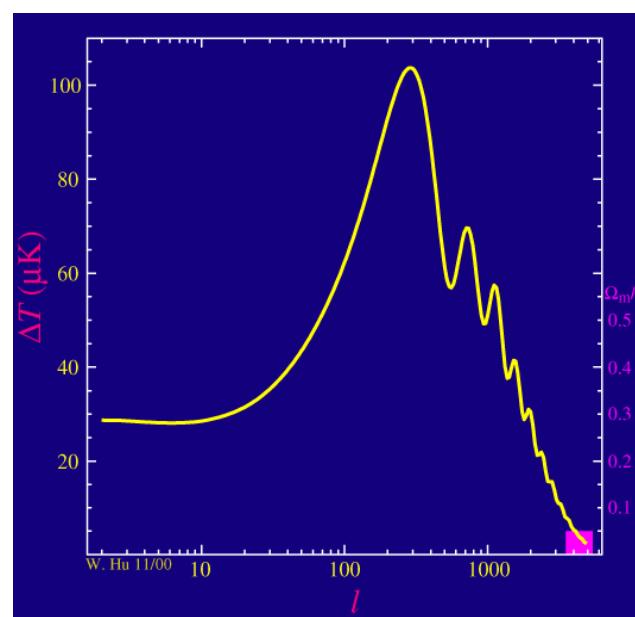

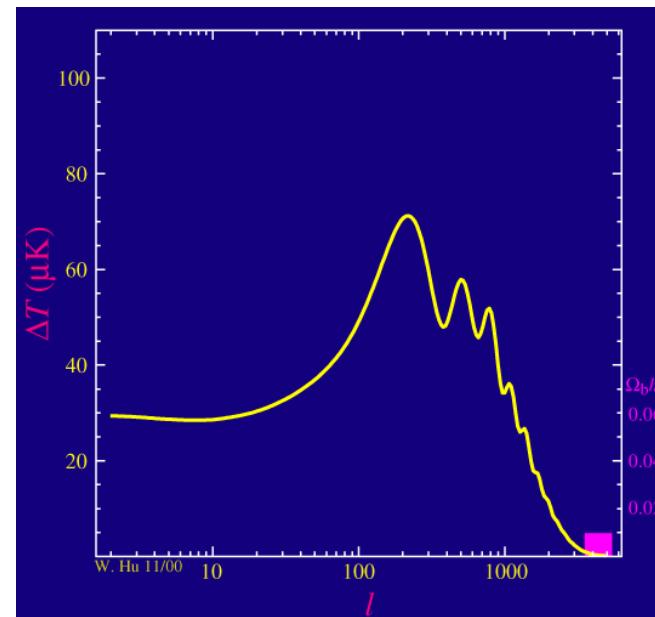

- The CMB is very smooth, but not exactly.
- There are 10^{-5} relative fluctuations
- Can do a spherical harmonic decomposition, which reveal the “power” at characteristic angular scales
 - Similar to 1-D Fourier transform
- Extremely good fit to the data

$$\theta \sim \frac{180^\circ}{\ell}$$

CMB Anisotropy

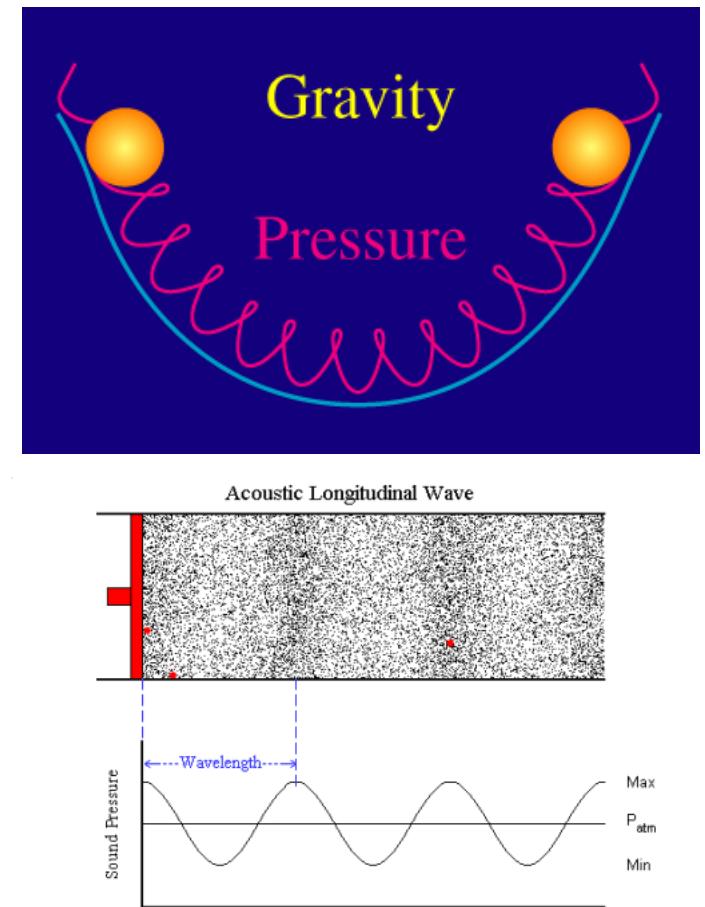

- Dark Matter + Baryon contributes to gravity
- Baryon contributes to pressure of the gas

COSMIC BACKGROUND RADIATION ANISOTROPIES IN UNIVERSES DOMINATED BY NONBARYONIC DARK MATTER

CMB Anisotropy

- The Origin of cosmological structures
 - Galaxies
 - Galaxy clusters
 - Cosmological bound structures

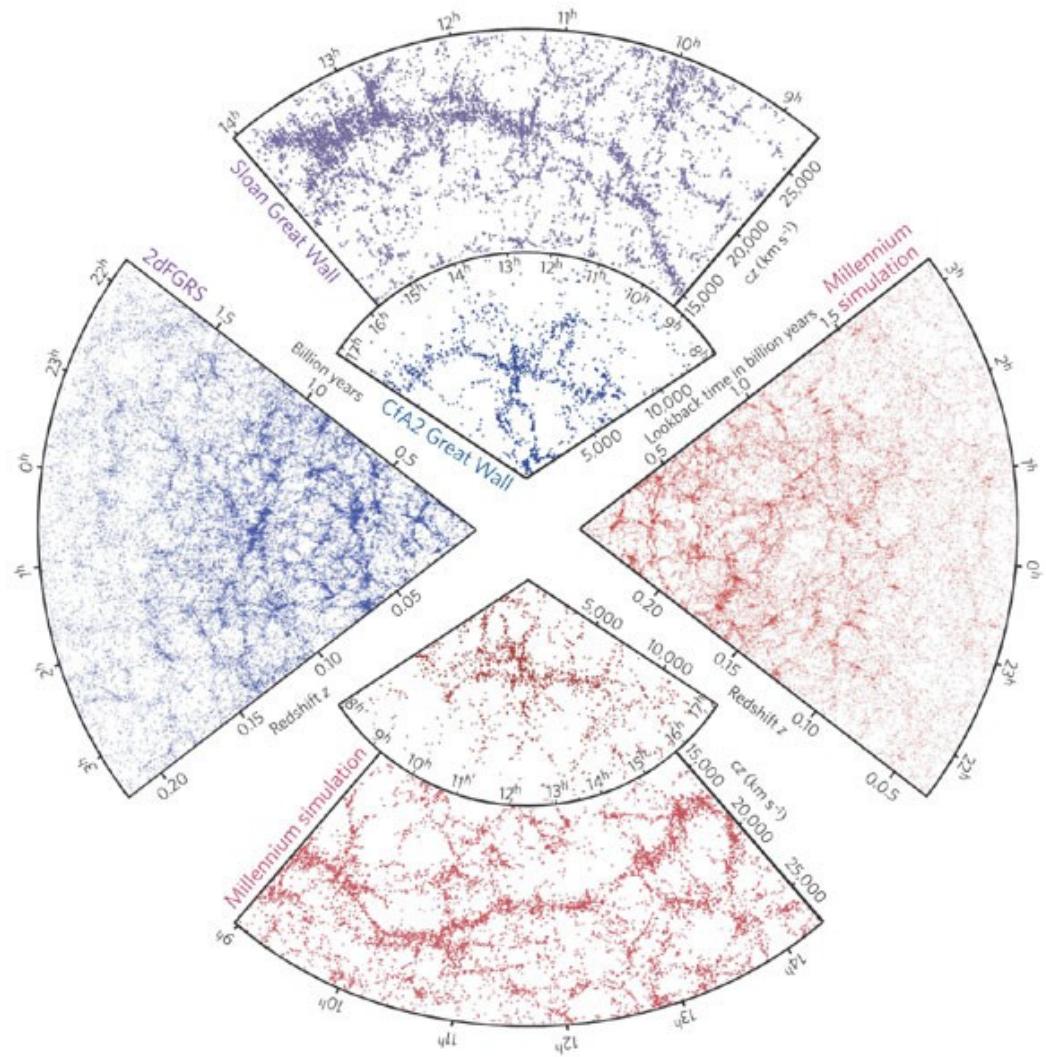

Dark Matter halo

- We expect all galaxies to sit inside a dark matter halo
- In galaxies clusters
 - A big halo
- In satellites galaxies
 - A small halo (sub halo)

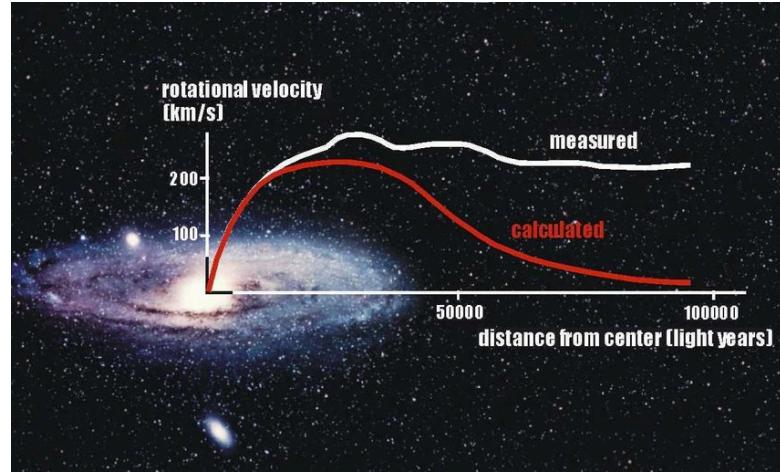

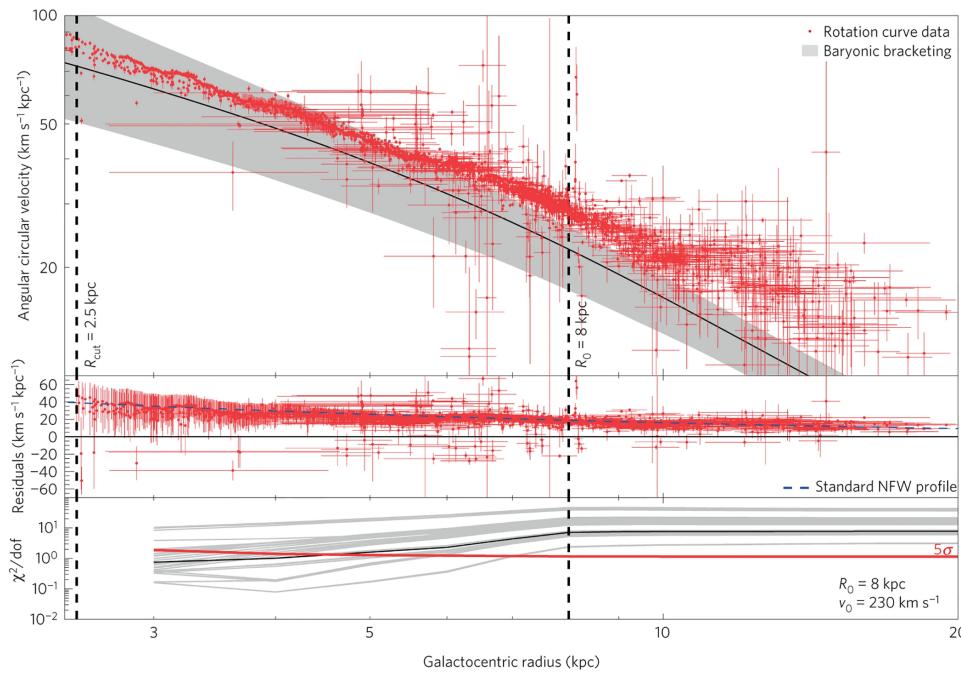

Large Scale Structures

- The distribution of galaxies
- Simulation vs observation.
- Dark Matter simulation seems works well!

Local scale

- Galaxy Scales
 - Galaxy Rotation Curve
 - Local stellar dynamics

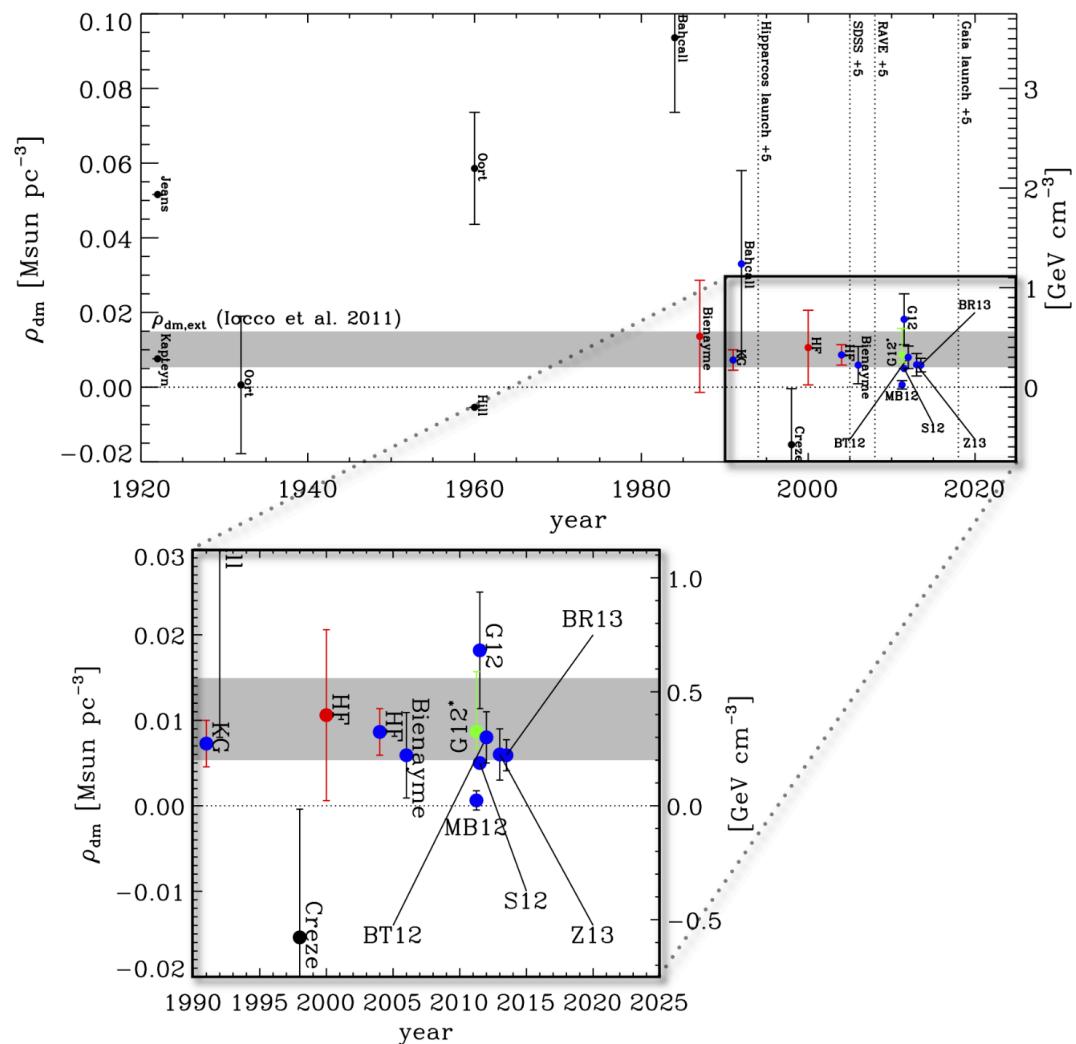

~1970 Rubin, Galaxy Rotation curves
Unobserved mass contributes to gravity

Local stellar dynamics required extra mass
 $\Rightarrow \rho_\chi \simeq 0.3 \text{ GeV cm}^{-3}$
<https://arxiv.org/abs/1502.03821>

Local Dark Matter density

<https://arxiv.org/pdf/1404.1938>

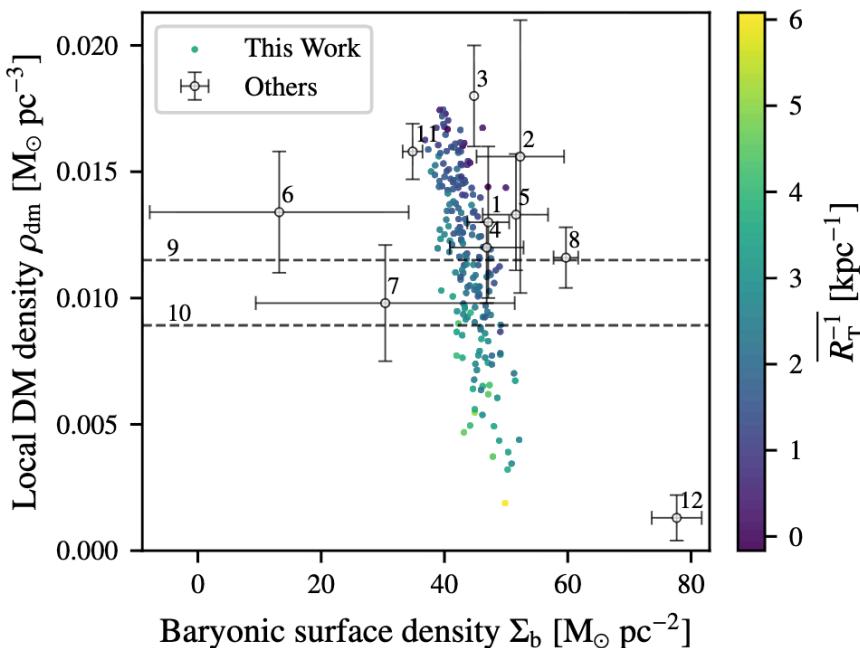

- Galaxy Scales
 - Galaxy Rotation Curve
 - Assume the shape of the DM halo
 - Local stellar dynamics
 - Measure the speed of the nearby stars
- As we measure more stars, the two approaches can be considered together
- About 0.3 GeV/cc

Local Dark Matter density

The ΛCDM model

- ~70% dark energy/cosmological constant
- ~30% Matter
 - ~25% Dark Matter
 - No particles in the Standard Model of particle physics can explain DM
 - New (Particle) Physics!
- Maybe gravity theory is wrong?
 - MOND, etc

VECTOR BOSONS

Cosmic neutrino background

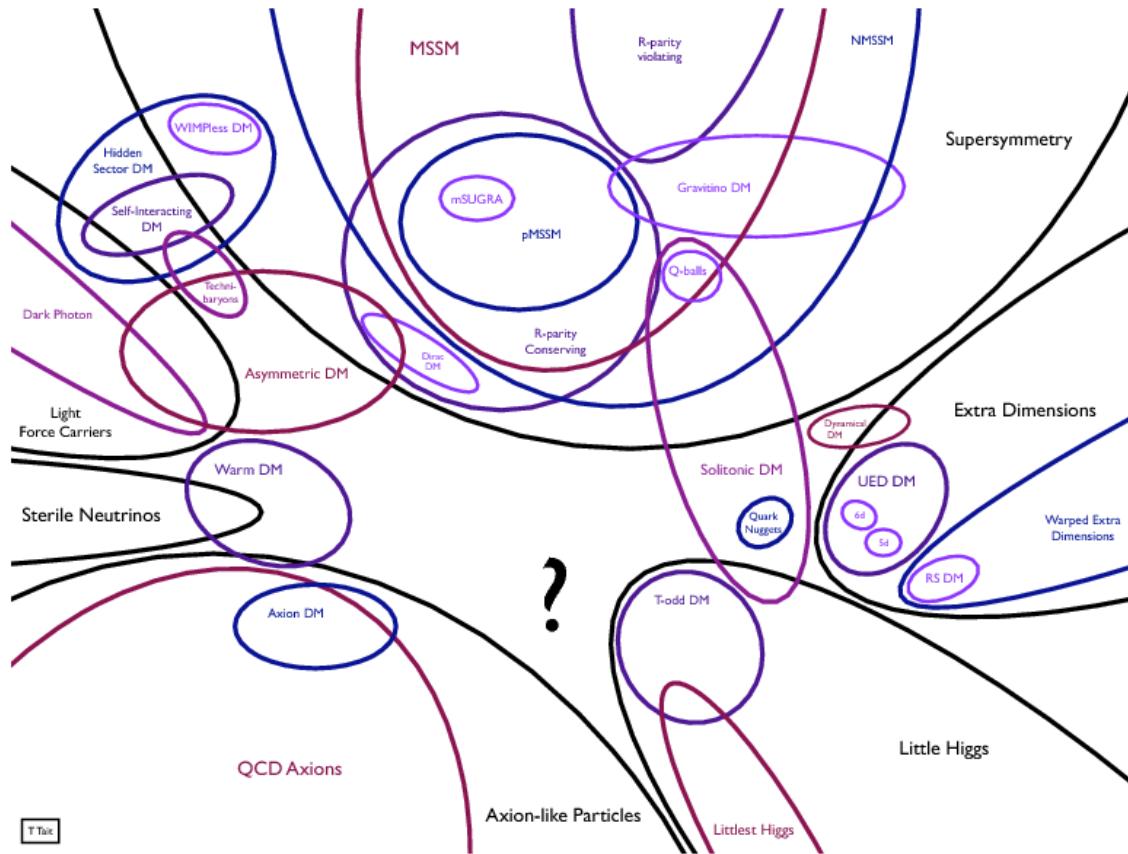

- $T_\nu = \left(\frac{4}{11}\right)^{\frac{1}{3}} T_\gamma \simeq 1.9K$
- Current neutrino number density, per flavor
- $n_\nu = \frac{3}{4} \frac{4}{11} n_\gamma \simeq 112 \text{ cm}^{-3}$
- Energy density
- $\Omega_\nu = \frac{m_\nu n_\nu}{\rho_{cr}} \Rightarrow \Omega_\nu h^2 = \frac{m_\nu}{94 \text{ eV}}$

Status of Dark Matter Research

- ❖ We know surprisingly a lot about dark matter
 - ❖ All from gravity
- ❖ How much (mass density) DM are there
- ❖ Where are they
- ❖ They need to be “cold”*
- ❖ They cannot interact with themselves too strongly, or dissipate*
- ❖ Other than that, we dont know anything about the identity of dark matter!
 - ❖ No Mass, spin, interactions, etc
- ❖ What is a good dark matter candidate?
- ❖ How the DM is produced with the right abundance?
 - ❖ Where does it come from
- ❖ How to test the DM model
 - ❖ Falsifiability
- ❖ Must satisfy the observation constraints
- ❖ Connect to other problems?
 - ❖ Is it related to dark energy?
 - ❖ Can it help unify the forces?
 - ❖ Can it help explain neutrino mass?
 - ❖

What is dark matter

- ❖ The biggest problem of dark matter
“identification problem”
- ❖ Too many dark matter candidates.

Too many candidates
for particle dark
matter!
